

Knet MaaS Software Distribution Service Powered by Fiberlink's MaaS360®

Overview

IT administrators today need to be able to distribute software in a controlled manner. Because users need so many applications to be productive, the distribution process is becoming an increasingly tedious, time consuming and costly one – one that often requires a dedicated team to manage efficiently. All this is happening when budget dollars and staff time are desperately needed for new projects.

As organizations get larger and the number of remote users increases, it is important to have a Software Distribution platform that can automate tasks, monitor status and reach devices that are not on the LAN.

KNet MaaS Software Distribution Service

KNet MaaS's Software Distribution service gives IT administrators centralized control over the software distribution process. It provides easy-to-use cloud-based package management and distribution capabilities from a central management portal.

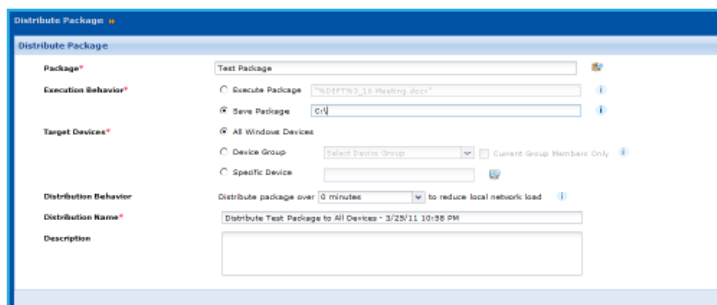

IT administrators can easily manage their company's package library and initiate deployments from any standard web browser to ensure that systems are always up to date, on or off the LAN.

It provides:

- Self-service capability to distribute packages
- Secure, cloud-based package storage and management functionality
- Secure package delivery, optimized by content Delivery Networks (CDNs), which provide increased scalability, performance and availability
- The ability to automatically restart an interrupted download. If the Internet connection is interrupted, KNet MaaS will resume the download when the connection is restored
- The ability to download a package, or to download and automatically install it on the devices
- The ability to distribute software to a specific device, a group of devices, or all devices
- Device-, distribution- and package-level tracking
- Support for the following:
 - Pre-install & post-install notifications to the users
 - Automated device restart logic
 - Custom success criteria for installation validation
- Audit reporting for all administrator actions

KNet MaaS Software Distribution with KNet MaaS Visibility

- Deploys quickly and cost-effectively, since no infrastructure or large software implementation is needed
- Provides an extended reach to patch both on- and off-LAN devices, protecting both the device and the data that resides on it
- Improved visibility and control over device software inventory status
- Simplified daily IT distribution workflows, from discovery, packaging and testing, through deployment, tracking and reporting
- Reduced costs for distribution operations

Self-Service Software Deployment

KNet MaaS's Software Distribution service provides an easy-to-use wizard that simplifies package creation and distribution.

Detailed Distribution Reports

KNet MaaS's Software Distribution Service provides detailed information about distributions that have been scheduled. Detailed reports monitor the progress and show exact status of each distribution in real time. These reports give administrators the information they need to track the overall status of large distribution actions to ensure critical distributions are received in a timely fashion, and provide an audit history if needed.
